

ANSWER KEY & MARKING SCHEME · CBSE CLASS 12

Algebra (Matrices and Determinants)

Applied Mathematics · Chapter 2 · Use this with the Board Paper · Companion to Quick Drill

HOW TO USE

Attempt the Board Paper first (closed-book, full time). Then come here. For 2-mark+ questions, compare your answer to the model. For 3-4 mark questions, also consult the **Topper Templates** below — these show the exact step-by-step structure that scores full marks per CBSE marking-scheme conventions.

MODEL ANSWERS · BOARD PAPER
Section A — Short calculation ($2 \times 3 = 6$ marks)
Q1. If $[[2x, 5], [7, y-3]] = [[8, 5], [7, 4]]$, find the values of x and y . [2 marks]

Ans: Equate corresponding entries: $2x = 8 \Rightarrow x = 4$; $y - 3 = 4 \Rightarrow y = 7$. Hence $x = 4, y = 7$.

Q2. Evaluate the determinant $|[[4,3],[2,5]]|$. [2 marks]

Ans: $|A| = (4)(5) - (3)(2) = 20 - 6 = 14$.

Q3. If $A = [[1,2],[3,4]]$, find $3A - 2I$, where I is the 2×2 identity matrix. [2 marks]

Ans: $3A = [[3,6],[9,12]]$; $2I = [[2,0],[0,2]]$; $3A - 2I = [[3-2, 6-0],[9-0, 12-2]] = [[1,6],[9,10]]$.

Section B — Problems with full working ($3 \times 4 = 12$ marks)
Q4. Express $A = [[1,3],[5,7]]$ as the sum of a symmetric and a skew-symmetric matrix. [3 marks]

Ans: $A' = [[1,5],[3,7]]$. Symmetric $P = (1/2)(A+A') = (1/2)[[2,8],[8,14]] = [[1,4],[4,7]]$. Skew $Q = (1/2)(A-A') = (1/2)[[0,-2],[2,0]] = [[0,-1],[1,0]]$. Check $P+Q = [[1,3],[5,7]] = A \checkmark$; diagonal of Q is zero \checkmark .

Q5. If $A = [[2,1],[3,2]]$ and $B = [[1,0],[1,1]]$, find AB . Is $AB = BA$? Justify. [3 marks]

Ans: $AB = [[2 \cdot 1 + 1 \cdot 1, 2 \cdot 0 + 1 \cdot 1], [3 \cdot 1 + 2 \cdot 1, 3 \cdot 0 + 2 \cdot 1]] = [[3,1],[5,2]]$. $BA = [[1 \cdot 2 + 0 \cdot 3, 1 \cdot 1 + 0 \cdot 2], [1 \cdot 2 + 1 \cdot 3, 1 \cdot 1 + 1 \cdot 2]] = [[2,1],[5,3]]$. Since $[[3,1],[5,2]] \neq [[2,1],[5,3]]$, $AB \neq BA$ — matrix multiplication is not commutative.

Q6. Find the inverse of $A = [[2,3],[1,4]]$ using the adjoint method. [3 marks]

Ans: $|A| = (2)(4) - (3)(1) = 8 - 3 = 5 \neq 0$, so A^{-1} exists. $\text{adj}(A) = [[4,-3],[-1,2]]$. $A^{-1} = (1/5)[[4,-3],[-1,2]] = [[4/5, -3/5],[-1/5, 2/5]]$. Check: $A \cdot A^{-1} = (1/5)[[5,0],[0,5]] = I \checkmark$.

Q7. Evaluate the determinant $|[[1,2,3],[4,5,6],[7,8,10]]|$ by expanding along the first row. [3 marks]

Ans: $|A| = 1 \cdot (5 \cdot 10 - 6 \cdot 8) - 2 \cdot (4 \cdot 10 - 6 \cdot 7) + 3 \cdot (4 \cdot 8 - 5 \cdot 7) = 1 \cdot (50 - 48) - 2 \cdot (40 - 42) + 3 \cdot (32 - 35) = 1 \cdot 2 - 2 \cdot (-2) + 3 \cdot (-3) = 2 + 4 - 9 = -3$.

Section C — Long-answer ($6 \times 2 = 12$ marks)
Q8. Solve the following system of equations by the matrix (inverse) method: $2x + 3y = 13$ and $x + y = 5$. Verify your solution in both equations. [6 marks]

Ans: Write $AX = B$ with $A = [[2,3],[1,1]]$, $B = [[13],[5]]$. $|A| = (2)(1) - (3)(1) = -1 \neq 0$, so a unique solution exists. $\text{adj}(A) = [[1,-3],[-1,2]]$; $A^{-1} = (1/-1)[[1,-3],[-1,2]] = [[-1,3],[1,-2]]$. $X = A^{-1}B = [[(-1)(13)+(3)(5)], [(1)(13)+(-2)(5)]] = [[-13+15],[13-10]] = [[2],[3]]$. So $x = 2, y = 3$. Verify: $2(2)+3(3) = 4+9 = 13 \checkmark$; $2+3 = 5 \checkmark$.

Q9. A shopkeeper sells two products. The cost matrix and quantity matrix give the total cost via matrix multiplication. Given and the system arising as $3x + 2y = 12$, $x + y = 5$, solve for x and y by the matrix method, and state the value of $x + y$. [6 marks]

Ans: Write $AX = B$ with $A = [[3,2],[1,1]]$, $B = [[12],[5]]$. $|A| = (3)(1) - (2)(1) = 1 \neq 0$, so a unique solution exists. $\text{adj}(A) = [[1,-2],[-1,3]]$; $A^{-1} = (1/1)[[1,-2],[-1,3]] = [[1,-2],[-1,3]]$. $X = A^{-1}B = [[1 \cdot 12 + (-2) \cdot 5], [(-1) \cdot 12 + 3 \cdot 5]] = [[12-10],[-12+15]] = [[2],[3]]$. So $x = 2, y = 3$, and $x + y = 5$. Verify: $3(2)+2(3) = 6+6 = 12 \checkmark$; $2+3 = 5 \checkmark$.

★ TOPPER TEMPLATE — 3 marks: 'Express $A = \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix}$ as the sum of a symmetric and a skew-symmetric matrix.'

Most years

Step 1 [1 mark]	State the decomposition formula	Any square matrix A can be written as $A = P + Q$, where $P = (1/2)(A + A')$ is symmetric and $Q = (1/2)(A - A')$ is skew-symmetric. First write the transpose: $A' = \begin{bmatrix} 2 & 6 \\ 4 & 8 \end{bmatrix}$.
Step 2 [1 mark]	Build the symmetric part	$P = (1/2)(A + A') = (1/2)[\begin{bmatrix} 2+2 & 4+6 \\ 6+4 & 8+8 \end{bmatrix}] = (1/2)[\begin{bmatrix} 4 & 10 \\ 10 & 16 \end{bmatrix}] = \begin{bmatrix} 2 & 5 \\ 5 & 8 \end{bmatrix}$. Check: $P' = P$ ✓ (the off-diagonal 5's are equal), so P is symmetric.
Step 3 [1 mark]	Build the skew part and verify the sum	$Q = (1/2)(A - A') = (1/2)[\begin{bmatrix} 2-2 & 4-6 \\ 6-4 & 8-8 \end{bmatrix}] = (1/2)[\begin{bmatrix} 0 & -2 \\ 2 & 0 \end{bmatrix}] = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$. Diagonal is all zero ✓ (skew condition). Verify: $P + Q = \begin{bmatrix} 2 & 5 \\ 5 & 8 \end{bmatrix} + \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} = \begin{bmatrix} 2 & 4 \\ 6 & 8 \end{bmatrix} = A$ ✓.

COMMON LOSS OF MARKS:

- Forgetting the factor of $1/2$ — writing $P = A + A'$ instead of $(1/2)(A + A')$.
- Writing the skew-symmetric matrix with a non-zero diagonal — by definition the diagonal must be all zeros.
- Not verifying $P + Q = A$ at the end; the verification line is worth a mark and catches arithmetic slips.

★ TOPPER TEMPLATE — 3 marks: 'Find the inverse of $A = \begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}$ using the adjoint method.'

Annual

Step 1 [1 mark]	Compute the determinant and confirm it is non-zero	$ A = (2)(4) - (3)(1) = 8 - 3 = 5$. Since $ A = 5 \neq 0$, A is non-singular, so A^{-1} exists.
Step 2 [1 mark]	Write the adjoint (2x2 shortcut)	For a 2×2 matrix $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$, $\text{adj}(A) = \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$ — swap the diagonal entries, negate the off-diagonal entries. So $\text{adj}(A) = \begin{bmatrix} 4 & -3 \\ -1 & 2 \end{bmatrix}$.
Step 3 [1 mark]	Assemble the inverse and verify	$A^{-1} = (1/ A) \cdot \text{adj}(A) = (1/5)[\begin{bmatrix} 4 & -3 \\ -1 & 2 \end{bmatrix}] = \begin{bmatrix} 4/5 & -3/5 \\ -1/5 & 2/5 \end{bmatrix}$. Verify: $A \cdot A^{-1} = (1/5)[\begin{bmatrix} 2 & 3 \\ 1 & 4 \end{bmatrix}] \cdot \begin{bmatrix} 4 & -3 \\ -1 & 2 \end{bmatrix} = (1/5)[\begin{bmatrix} 8-3 & -6+6 \\ 4-4 & -3+8 \end{bmatrix}] = (1/5)[\begin{bmatrix} 5 & 0 \\ 0 & 5 \end{bmatrix}] = I$ ✓.

COMMON LOSS OF MARKS:

- Attempting the inverse without first checking $|A| \neq 0$.
- Forgetting to divide by $|A|$ — leaving the answer as $\text{adj}(A)$ only.
- Sign error in the 2×2 adjoint shortcut: only the OFF-diagonal entries are negated, the diagonal entries are SWAPPED (not negated).

★ TOPPER TEMPLATE — 5 marks: 'Solve by the matrix method: $2x + 3y = 13$ and $x + y = 5$.'

Annual

Step 1 [1 mark]	Write the system as $AX = B$	$A = \begin{bmatrix} 2 & 3 \\ 1 & 1 \end{bmatrix}$, $X = \begin{bmatrix} x \\ y \end{bmatrix}$, $B = \begin{bmatrix} 13 \\ 5 \end{bmatrix}$. The system $AX = B$ has solution $X = A^{-1}B$ provided $ A \neq 0$.
Step 2 [1 mark]	Compute the determinant	$ A = (2)(1) - (3)(1) = 2 - 3 = -1$. Since $ A = -1 \neq 0$, the system has a unique solution and A^{-1} exists.
Step 3 [1 mark]	Find the inverse	$\text{adj}(A) = \begin{bmatrix} 1 & -3 \\ -1 & 2 \end{bmatrix}$. $A^{-1} = (1/ A) \cdot \text{adj}(A) = (1/-1)[\begin{bmatrix} 1 & -3 \\ -1 & 2 \end{bmatrix}] = \begin{bmatrix} -1 & 3 \\ 1 & -2 \end{bmatrix}$.
Step 4 [1 mark]	Multiply $X = A^{-1}B$	$X = A^{-1}B = \begin{bmatrix} -1 & 3 \\ 1 & -2 \end{bmatrix} \cdot \begin{bmatrix} 13 \\ 5 \end{bmatrix} = \begin{bmatrix} (-1)(13) + (3)(5) \\ (1)(13) + (-2)(5) \end{bmatrix} = \begin{bmatrix} -13 + 15 \\ 13 - 10 \end{bmatrix} = \begin{bmatrix} 2 \\ 3 \end{bmatrix}$. So $x = 2$, $y = 3$.
Step 5 [1 mark]	Verify in both original equations	Check eq.1: $2(2) + 3(3) = 4 + 9 = 13$ ✓. Check eq.2: $2 + 3 = 5$ ✓. Both equations are satisfied, so $x = 2$, $y = 3$ is the correct solution.

COMMON LOSS OF MARKS:

- Not stating $|A| \neq 0$ before claiming a unique solution exists.
- Sign slip when dividing the adjoint by a NEGATIVE determinant.
- Skipping the final verification — substituting back into both equations is worth a mark and proves the answer.

MARKING SCHEME — GENERAL NOTES

- For equality of matrices, state the corresponding-entry equations explicitly before solving.
- Symmetric/skew decomposition: ALWAYS include the $1/2$ factor and verify $P + Q = A$; confirm the skew diagonal is all zeros.
- Matrix multiplication: show the row-times-column products; never assume $AB = BA$.
- 3×3 determinant: write the $+ - +$ sign pattern and keep each minor's own sign explicit.
- Inverse / system: compute $|A|$ FIRST; if $|A| = 0$ state that the inverse does not exist. Always verify $A \cdot A^{-1} = I$, or substitute the solution back into every equation.
